#### Abstract

This report documents what are the most cited articles published in the top-5 economics journals during the period 1991-2015. EconLit is used to collect bibliographic information about these articles, and we gathered yearly citations for each paper through the Web of Science database. We present different sorts of citation lists. Our most basic one ranks articles on the basis of the cumulated number of citations received between year of publication and 2015. To facilitate the comparison of articles of different ages, we also consider rankings by subperiods, and on the basis of normalized citations per year. Finally we report lists by field of economic research, as defined by the JEL codes of the papers. The report contains Internet links to all articles, allowing an easy and direct access to arguably the most influential economics literature published in the last 25 years.

# Introduction

What are the most influential economics papers in the recent economics literature? And what are the papers that have attracted the most attention by field of economic research (labor, IO, econometrics, trade, etc.)? To answer these questions, we have collected bibliographic information on all articles published between 1991 and 2015 in the top-5 economics journals (AER, ECMA, JPE, QJE, and RESTUD). To measure the academic influence of these articles, we have also retrieved yearly citations for each of them. We use this database to document many different lists of articles. Our most basic one considers all articles (irrespective of research field) and is based on the cumulated number of citations received between the publication year and 2015. This list contains a wide range of amazingly highly cited papers, covering all fields of economics, from pure econometrics to development economics or lab experiments. The drawback of this basic ranking is that old papers (with a long time span to gather citations) are compared with young ones (short time span to collect citations). We therefore proceed by giving lists of the most cited articles by sub-periods, and on the basis of citations that are normalized by year of publication. Finally, we list articles by field of economic research as defined by the JEL codes of the articles. We shall comment only briefly on the lists, and let instead readers appreciate and go through our different rankings by themselves.

All our rankings contain direct web links to the articles (clicking on them gives access to the pdf files),<sup>1</sup> allowing for easy and direct access to a highly selective set of prominent economics papers. As such, this report can be useful for researchers wishing to read relatively new papers that have the potential of becoming or already are classics in the literature. Our report may also be helpful in guiding starting PhD students on what they should read to get a good picture of what is important in their chosen domain of research.

### 1 Methodology and data

Our data set is constructed by combining two sources. First, we used EconLit<sup>2</sup> to collect bibliographic information about articles published in the top-5 economics journals between 1991 and 2015. We kept all articles published in this period except the ones that appeared in AER Papers and Proceedings, the comments on previously published papers (and replies to comments),<sup>3</sup> corrections on articles, editorial statements, and all sorts of other announcements. Second, we gathered citation statistics on all these articles using the Web of Science database (hereafter *WoS*). For each top-5 article we thus observe the yearly number of citations (between the publication year and the end of 2015), in any of the academic journals referenced in the *WoS*. Since all academic fields are covered in the *WoS*, our measure of citations obtained through EconLit and *WoS* by matching on the author names and titles of the articles.<sup>4</sup> Our final database contains 6,816 articles.<sup>5</sup>

There are similarities and differences between our database and the ones used in the closely related literature. Card and DellaVigna (2013), Hamermesh (2013) and Anauati, Galiani, and Gálvez (2016) also focus on publications in the top-5 journals but these studies are based on slightly longer observation periods. Card and DellaVigna and Anauati, Galiani, and Gálvez study all articles that appeared during 1970-2012

<sup>&</sup>lt;sup>1</sup>Direct consultation of the articles requires, however, a subscription to JSTOR (otherwise the links only give access to the abstracts and titles of the papers).

<sup>&</sup>lt;sup>2</sup>We used the AEA member access which appeared to be the most convenient way.

<sup>&</sup>lt;sup>3</sup>Comments (and replies) can be interesting but they are different in nature from standard articles. They are also much shorter and generally less cited so including them would bias the results for the journals that tend to publish them (primarily AER).

 $<sup>^{4}</sup>$ For about 95% of the articles the matching was immediate, for the remaining 5% we had to check manually because of small spelling mistakes.

 $<sup>^{5}</sup>$ Some articles published in 2015 are missing (basically the last issue of all journals) because the EconLit database was not yet completed by the Spring of 2016. So about 36 articles are missing. For our purpose here it is not an issue as these last articles of 2015 could not possibly have many citations.

and 1970-2000, respectively. The analysis of Hamermesh covers the period 1963-2011, but his sample only contains six publication years (one year per decade).

Unlike our database, Card and DellaVigna (2013) and Anauati, Galiani, and Gálvez (2016) measure citations using Google Scholar (GS).<sup>6</sup> The latter article uses the yearly number of GS citations, while the former one only uses the cumulated number of citations (between the year of publication and October 2012). The advantage of GS citations is that they are more broadly defined since they cover not just citations in academic journals (as WoS), but also the ones appearing in unpublished worker papers. The disadvantage is that GS does not record journal citations as systematically as the WoS (a journal citation may remain unrecorded if it can somehow not be retrieved on the Internet). Furthermore, especially citations form older working papers (e.g., those dating from the 70s) may be missed out in the GS counts as they may never have been posted on the Internet.

Our goal is to provide lists of articles with the largest number of citations in WoS. This is similar to Kim, Morse, and Zingales (2006) who look at the 146 articles (published in 41 journals) that have received more than 500 citations in WoS between the publication year and June 2006. The main difference is that we have all articles but in a narrower set of journals (in their list of 146 articles about 2/3 are from the top-5).

Table 1 reports the number of published articles in each of the five journal, separately for the whole observation period and for 5 sub-periods of 5 years each. Publications in the AER and ECMA are decomposed into regular (r) and short (s) publications.<sup>7</sup>

	All years	91-95	96-00	01-05	06-10	11-15				
aer (r)	1,555 (100) (22.8)	281 (18.1) (20.0)	239(15.4) (20.0)	277 (17.8) (19.6)	320(20.6) (23.9)	438(28.2) (30.0)				
aer (s)	(100) (100) (10.1)	$ \begin{array}{c} (10.0) \\ 133 (19.3) \\ (9.4) \end{array} $	(13.8) (7.9)	(10.0) 166 (24.1) (11.7)	(10.0) (144 (20.9) (10.8)	(50.6) 151 (21.9) (10.3)				
aer (all)	2,244 (100) (32.9)	414 (18.4) (29.4)	334 (14.9) (27.9)	$\begin{array}{c} 443 \ (19.7) \\ (31.4) \end{array}$	$\begin{array}{c} 464 \ (20.7) \\ (34.7) \end{array}$	589 (26.2) (40.3)

jpe	1,021 (100) (15.0)	245 (24.0) (17.4)	244 (23.9) (20.4)	231 (22.6) (16.3)	158 (15.5) (11.8)	143 (14.0) (9.8)				
qje	1,053 (100) (15.4)	242 (23.0) (17.2)	202 (19.2) (16.9)	202 (19.2) (14.3)	(15.8) (20.0)	196(18.6) (13.4)				
restud	1,069(100) (15.7)	$\begin{array}{c} 215 \ (20.1) \\ (15.3) \end{array}$	(170 (15.9)) (14.2)	206 (19.3) (14.6)	237 (22.2) (17.7)	241 (22.5) (16.5)				
All	6,816 (100) (100)	$\begin{array}{c} 1408 \ (20.7) \\ (100) \end{array}$	1196 (17.5) (100)	$\begin{array}{c} 1413 \ (20.7) \\ (100) \end{array}$	1337 (19.6) (100)	$\begin{array}{c} 1462 \ (21.4) \\ (100) \end{array}$				

Table 1: Number of articles per journal

About 33% of our total of 6,816 articles have been published in AER, 21% in ECMA, 15% in JPE, 15% in QJE, and 16% in RESTUD. The total production is relatively evenly distributed across the five sub-periods: 1,408 in the period 1991-1995, 1,196 in 1996-2000, 1,413 in 2001-2005, 1,337 in 2006-2010, and 1,462 in 2011-2015. These aggregate figures hide that AER has augmented its number of publications during the observation period (from 29% of all publications in 1991-1995 to 40% in 2011-2015), while JPE and QJE

 $<sup>^{6}</sup>$ Hamermesh (2013) does not observe the citations in his data.

<sup>&</sup>lt;sup>7</sup>Short publications refer to the 'Shorter papers' in AER and the 'Notes and comments' in ECMA.

have decreased their publications (from 17 to 10% for JPE, and from 17 to 13% for QJE). The fraction of publication published in ECMA and RESTUD has remained relatively stable.

# 2 Citations cumulated at the end of 2015

In this section we give the list of most cited articles according to the cumulated number of citations between the publication year and the end of 2015. This is a crude but natural way to look at citations (at least as a first benchmark analysis). The obvious drawback with this analysis is that younger articles have had less time to accumulate citations than older ones. The distributions of the cumulated citations are summarized in Table 2 for each journal.

										-			
	Ν	mean	$\sigma$	min	p5	p10	p25	p50	p75	p90	p95	p99	max

Table 2: Cumulated citations at the end of 2015

Several quick remarks can be made. First, the articles in our sample have received many citations: about 84 on average and a median equal to 36. At the very top, the 69 articles in the last percentile have each at least 734 citations. Second, the average and all percentiles of QJE articles are higher than those of articles published in the four other journals. Third, RESTUD published the article with the highest number of citations. Fourth, AER (s) and ECMA (s) are comparable to RESTUD. In fact, articles in AER (s) have even more citations (on average) than articles in RESTUD and the difference is significantly different from zero.

We list the top 1% of the most cited articles in Table 3. For each article, one can access its JSTOR page by clicking on the title (in the pdf version of this report). The first column gives the rank of the article, the second one the total number of citations received between the publication year and the end of 2015, and the third column the title of the paper.<sup>8</sup> The fourth column lists the name(s) of the author(s) (when there is only one or two coauthors, otherwise only the name of the first author is given), and the column indicates the journal and the publication year. The sixth column gives all the JEL codes of the article (aggregated at the one digit level), and the seventh column indicates the type of the article. Using the JEL codes, keywords, and in particular the abstracts we have (non-manually) classified articles into three types: Data, experiment, and theory.<sup>9</sup> Finally, the eighth column gives the percentage of authors with a position in the USA (1 if all authors work in the USA, 0.5 if half of the authors are affiliated with a U.S. institution, etc.).

<sup>&</sup>lt;sup>8</sup>For space limitations, only the first 50 characters are shown, or less if the title contains an interrogation mark or a colon. <sup>9</sup>Hamermesh (2013) implements a finer typology with five types: theory, theory with simulation, empirical using borrowed data, empirical using self generated data, and experiment. He only had to classify 748 articles whereas our database contains 6,816 articles. Another manual classification has been done by Anauati, Galiani, and Gálvez (2016). They classified the articles into 4 research fields (applied, applied theory, econometric methods, and theory). As our classification is non manual, it is not perfect.

The top-1% list is made up of 70 articles. At the very top the distribution of citations is very skewed as these articles count for 15.6% of all citations in our sample. On average, an article in the list has 1,280 citations. The most cited article is (by far) "Some Tests of Specification for Panel Data: Monte Carlo Evidence and an Application to Employment Equations" by Manuel Arellano and Stephen Bond with 4,285 citations (923 more citations than the second one, or 27% more). It was published in RESTUD in 1991 and at that time both authors were working in the U.K.: Arellano at the LSE and Bond at Oxford university. In a sense, this article is atypical first because it is published in RESTUD (only 4 articles in the list are published by this journal), and second because both its authors were affiliated with institutions outside the U.S. (as the last column of the table shows most articles are written at least in part by U.S. based economists).

Among the 70 articles, 18 are published in the AER (including 4 short articles), 15 in ECMA (including 1 short article), 10 in JPE, 23 in QJE, and 4 in RESTUD. This clearly illustrates the dominant position of QJE discussed earlier. Given the citation measure chosen here, it does not come as a surprise that many articles in the list are rather old. Half of them have been published in the period 91-95, 24 in 90-00, and 11 in 01-05. The most recent paper is "Nominal Rigidities and the Dynamic Effects of a Shock to Monetary Policy" by Lawrence J. Christiano, Martin Eichenbaum and Charles L. Evans, published in JPE in 2005. It is ranked 40th with already 1,047 citations cumulated over 10 years.

Clearly the field growth/trade is over-represented in this list as the word "growth" appears in 16 of the 70 titles (23%). There are also relatively many articles that have at least one "C" among their JEL codes (13, or 18.6%). Relatively many articles are thus based on mathematical or quantitative methods. The other articles are split evenly among the other fields (as defined by the JEL codes). Looking at the column describing the type of article, it is also apparent that a majority of the articles in the list are data-oriented: either because their contribution is in the field of econometrics (with or without empirical application), or because their goal is primarily empirical (analysis of a dataset). Theoretical papers are relatively rare, only 18 fall into this category (26%). This contrasts with the full sample where 47% of the articles are classified theoretical. Admittedly, not all the articles that fall in this category are theoretical in the usual sense. For example, the paper "Corruption" by Shleifer and Vishny, published in QJE in 1993, contains not more than a single equation. Finally, 81.7% of the authors of the top-1% articles work in the USA, compared to 69.5% in the full sample.

# 3 Lists for five-year time periods

A drawback of the analysis in the previous section is that by measuring influence via the cumulated number of citations, recent articles are disadvantaged compared to old ones. Comparing two articles, one published in say 1992 and the other in 2002 is unfair in the sense that the former has had 10 more years than the latter to accumulate citations. In this section we propose a more equitable and balanced analysis by comparing articles published in subperiods. For instance, we start by considering all articles published in the period 1991-1995, and take as our measure of influence of an article its cumulated number of citations obtained in the interval [year of publication, year of publication +20]. We then move on to the period 1996-2000, and rank articles on the basis of their total number of citations cumulated in the interval [year of publication, year of publication +15]. As we analyze more recent periods, the time interval over which citations are counted gets shorter, but the important thing here is that all articles are treated equally.

#### 3.1 1991-1995

Between 1991 and 1995 a total of 1,424 articles have been published. Table 4 lists the 25 most cited articles for this period of time. The table is organized as before except that the second column now gives the cumulated number of citations gathered by each article between its publication year and 20 years thereafter (denoted  $C_i(20)$ ). The article by Arellano and Bond is at the top of this list as well. Actually all articles listed here appear in Table 3 as well.

Rank	$C_i(20)$	Title	Authors	Journal	JEL	Type	USA

Table 4: Top 25 articles for T = 1991 - 1995

#### 3.2 1996-2000

Between 1996 and 2000 a total of 1,213 articles have been published in the top-5 journals. Table 5 gives the ranking of the 25 most cited articles for this time period. Note that the second column is now labelled  $C_i(15)$ , to indicate that the lifespan over which citations are counted for each article is 15 years here. This list is headed by "Law and Finance," an article published in JPE in 1998 and written by La porta et al. Again, most articles here appear also in the top-1% list reported in Table 3. There are, however, some newcomers as well. For instance, the article "Measuring Trust" by Glaeser et al., published in QJE in 2000, is ranked 25th but is not among the papers listed in Table 3.

Table 5: Top 25 articles for T = 1996 - 2000

# 3.3 2001-2005

Between 2001 and 2005 a total of 1,420 articles have been published, and Table 6 gives the ranking of the 25 most cited ones for this time period. At the top of this list is "How Much Should We Trust Differencesin-Differences Estimates?", written by Bertrand et al. and published in QJE in 2004. This article has accumulated an impressive number of citations over a relatively short time span (10 years).

#### $3.4 \quad 2006-2010$

In the most recent period that we consider, 2006-2010, a total of 1,347 articles have been published in the top-5 journals, and Table 7 gives the ranking of the 25 most cited articles for this time period. The article "Shocks and Frictions in US Business Cycles: A Bayesian DSGE Approach" by Smets and Wouters, and published in AER in 2007, is ranked first and has gathered 297 citations over a period of 5 years. None of the articles in this list appears in Table 3. Although these articles have accumulated an impressive number of citations in a short timespan, they are published very recently and cannot compete on an equal level with articles published in the early 1990s.

Table 8: Top 25 articles for T = 2011 - 2015

# 4 Normalized citations by publication year

In the previous section we have listed the most cited articles by five-year periods wherein the papers were published. These listings are difficult to compare across the different subperiods because the time span over which the cumulated citations are calculated vary (e.g., the time span corresponding to Table 4 is 20 years, while the one corresponding to Table 7 is only 5 years). Even within a subperiod, articles are not completely comparable because in our data there is a clear upward trend in the number of citations. This increasing number of citations over time is due to an increase in the number of journals (that can cite our top-5 articles), and also because reference lists in academic articles tend to get longer and longer.<sup>10</sup> To account for these two factors, we present in this section listings based on normalized citations.

Let  $C_i$  be the cumulated number of citations gathered by article *i* at the end of 2015. Furthermore, let I(t) denote the set of all articles published in year *t* in the five journals, and  $N_t$  the total number of articles published in that year (i.e., the number of elements in I(t)),  $t = 1991, \dots, 2015$ . Finally, let  $t_i$  be

 $<sup>^{10}</sup>$ This upward trend in the length of reference lists is also mentioned in Ellison (2002). In our data, among the articles published during 1991-1995, the average number of references per article is 25.8, while among articles published during 2011-2015 it is 44.8.

the publication year of article *i*. Our normalized number of citations, denoted  $\widetilde{C}_i$ , is now defined as

$$\widetilde{C}_i = 100 \frac{C_i}{\overline{C_{t_i}}}$$

where  $\overline{C_{t_i}}$  is the average number of cumulated citations received per article published in year  $t_i$ , i.e.,  $\overline{C_{t_i}} = \frac{1}{N_{t_i}} \sum_{j \in I(t_i)} C_j$ . The interesting property of  $\widetilde{C_i}$  is that it has the same mean for all publication years.

The figures in Figure 1 help to visualize the impact of our normalization. The left hand-side figure plots for each year (from 1991 to 2015) and for each journal the median of  $C_i$  whereas the right hand-side figure plots the same information but for  $\widetilde{C}_i$ . After normalization there are still variations (for a given journal) across time but much less so than before the normalization. The medians for 2015 are quite erratic as the articles had less than one year to be cited.

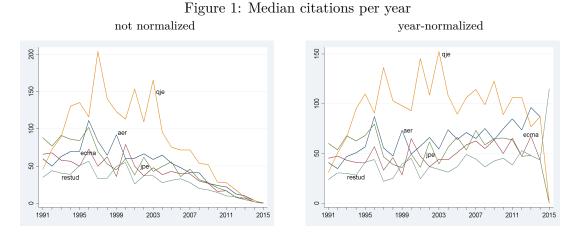

Table 9 summarizes the distributions of the year-normalized citations. Compared to Table 2, QJE is still dominant at each percentile. The JPE concedes its second place to the AER and is now closely followed by ECMA.

Table 9: Year-normalized citations

Table 10 lists the top 1% of the most cited articles once citations are normalized.<sup>11</sup> To highlight the changes with respect to Table 3 we put two ranks:  $\widetilde{R}$  is the rank in terms of normalized citations whereas R is the rank before the normalization. The column  $\widetilde{C}_i$  gives the value of the normalized citations and in

<sup>&</sup>lt;sup>11</sup>Articles published in 2015 are excluded because especially the ones published towards the end of that year had little time to obtain citations, and also because, as mentioned earlier, for all journals except AER the last issues are not (yet) included in EconLit.

parenthesis the number of citations  $C_i$ . We also colored in red the titles of the articles which are not in the top 1% before the normalization. Otherwise the structure of the table is the same. We see that blue dominates the table which indicates that to a certain extent the most basic ranking is robust to introducing the normalized citations. The first two articles are even exactly the same in both tables.

The comparison of Tables 3 and 10 shows our normalization leads to an increase in the number of AER (+3) and QJE (+2) articles in the top-70. On the other hand ECMA (-2) and JPE (-3) have a few less articles. Thanks to the normalization articles also tend to be younger. Two articles published in 2014 now enter the list: "A Macroeconomic Model with a Financial Sector" by Markus K. Brunnermeier and Yuliy Sannikov, and "Do Consumers Respond to Marginal or Average Price" by Koichiro Ito, both published in AER.

# 5 Lists by JEL codes

Many articles have several JEL codes (at the two digit level). In our data, the majority of articles (75%) use less than 3 codes, but 10% of them have more than 5 codes. In the analysis of this section we only use JEL codes at the letter level. For example, if an article has C70, C72, and D63 as JEL codes, then at the letter level it has two JEL codes: C (with a weight 0.66) and D (with a weight 0.33). At this letter level, 90% of the articles have at most two JEL codes.

In the left panel of Table 11 we present the usage of JEL codes (in percentage) for our different time periods.<sup>12</sup> The right panel shows the average of the normalized citation per subperiod and JEL code. To find the meaning of a JEL code one can click on it (in the pdf version of this report).

Table 11: JEL codes:

The most popular code is D (Microeconomics) with 26.5% of all JEL codes being in that category. In addition, this field of economics is getting more and more popular as the percentage of the D code has climbed from 24.6% in 91-95 to 29.0% in 11-15. However, in terms of citations it is only ranked 10th with 39.4 citations on average. The JEL code with the highest average citation is O (Economic Development, Innovation, Technological Change, and Growth). Only 5.5% of the JEL codes are in this category but they receive on average 69.8 citations (with a stunning 215.5 average in 91-95). Codes F (International Economics) and R (Urban, Rural, Regional, Real Estate, and Transportation Economics) have also a higher rank in terms of average citations than in terms of usage.

The fact that not all JEL codes receive the same amount of citations means that in the list of Tables 3 and 10 some fields are over-represented compared to their sizes. The simplest way to give each field a fair chance is to present lists by JEL codes. For all lists presented in this section the articles published in 2015 are excluded as for them it is impossible to normalize their citations.

<sup>&</sup>lt;sup>12</sup>Kelly and Bruestle (2011) have studied in more detail the evolution of JEL codes usage from 1970 to 2007.

#### 5.1 Code D: Microeconomics

Table 12 reports the number of published articles with at least one JEL code D, for each journal and both the full period and our five subperiods. Publications in the AER and ECMA are decomposed in regular and shorter publications. This table should be compared with Table 1. The JEL code D is used very frequently.

	All years	91-95	96-00	01-05	06-10	11-15

Table 12: Nb of articles with at least one JEL code D

Table 12 shows that out of 6,816 articles 3,020 have at least one JEL code D. It appears in all journals but slightly less in QJE and slightly more in RESTUD. Table 13 summarizes the distributions of year-normalized citations for JEL code D per journal (year 2015 is excluded here). They should be compared to the ones of Table 9.

Table 13: Year-normalized citations for JEL code D

All	2,850	49.02	73.09	0	3	6	12	28	58	112	160	321	1,231

Table 14 lists the top 50 articles with at least one JEL code D. The articles are ranked according to their year-normalized number of citations weighted by the percentage of JEL code D among their JEL codes. The number in parentheses is the number of weighted citations (i.e., without the normalization per year).

For example, the article "Corruption and Growth" is ranked first both after the normalization (column R) and before the normalization (R). It received 1,516 citations which are normalized to 1,231. As indicated by the column labeled 'pct' all the JEL codes of this article are in the D category. Regarding the article "A Theory of Fairness, Competition, and Cooperation", only 50% of its JEL codes are in the D category. Therefore its total number of citations (either normalized or not) is divided by two in this table. Finally, articles which are ranked below 50 after the normalization but above 50 before are in red.

#### Table 14: Top 50 articles for T = 1991 - 2014 Code D, normalized per year

#### 5.2 Code C: Mathematical and Quantitative Methods

Table 15 reports the number of published articles with at least one JEL code C, for each journal and both the full period and our five subperiods. Publications in the AER and ECMA are decomposed in regular and shorter publications. It shows that out of 6,816 articles 1,288 have at least one JEL code C.

Table 15: Nb of articles with at least one JEL code C

This table should be compared with Table 1. ECMA publishes the majority of the articles with a JEL code C: almost 60% over the whole period. The AER is second but compared to Table 1 code C is underrepresented. For RESTUD the percentages for code C articles are similar to the percentages for all articles. Finally, for JPE and QJE this is much less present: 3.2% and 2.9% respectively whereas these journals have published 15% and 15.4% of all articles respectively.

Table 16 summarizes the distributions of year-normalized citations for JEL code C per journal (year 2015 is excluded here). They should be compared to the ones of Table 9.

# Table 17: Top 50 articles for T=1991-2014 Code C, normalized per year

#### 5.3 Code J: Labor and Demographic Economics

Table 18 reports the number of published articles with at least one JEL code J, for each journal and both the full period and our five subperiods. Publications in the AER and ECMA are decomposed in regular and shorter publications. It shows that out of 6,816 articles 1,297 have at least one JEL code J.

Table 18: Nb of articles with at least one JEL code J

This table should be compared with Table 1. If all JEL codes were equally represented in each journal, the percentages of both tables would be the same. Labor and Demographic Economics is under-represented ECMA (8.2% instead of 21%). On the other hand, this field is relatively more present in JPE and QJE.

Table 19 summarizes the distributions of year-normalized citations for JEL code J per journal (year 2015 is excluded here). They should be compared to the ones of Table 9.

#### 5.4 Code E: Macroeconomics and Monetary Economics

Table 21 reports the number of published articles with at least one JEL code E, for each journal and both the full period and our five subperiods. Publications in the AER and ECMA are decomposed in regular and shorter publications. It shows that out of 6,816 articles 1,018 have at least one JEL code E.

Table 21: Nb of articles with at least one JEL code E

This table should be compared with Table 1. If all JEL codes were equally represented in each journal, the percentages of both tables would be the same. Macroeconomics and Monetary Economics articles are over-represented in the AER (42.4% instead of 32.9%), but under-represented in ECMA (10% rather than 21%).

Table 22 summarizes the distributions of year-normalized citations for JEL code E per journal (year 2015 is excluded here). They should be compared to the ones of Table 9.

Table 22: Year-normalized citations for JEL code E

#### 5.5 Code G: Financial Economics

Table 24 reports the number of published articles with at least one JEL code G, for each journal and both the full period and our five subperiods. Publications in the AER and ECMA are decomposed in regular and shorter publications. It shows that out of 6,816 articles 922 have at least one JEL code G.

Table 24: Nb of articles with at least one JEL code G

This table should be compared with Table 1. If all JEL codes were equally represented in each journals, the percentages of both tables should be the same. Financial Economics articles are slightly more present in the AER and QJE and under-represented in ECMA. Table 25 summarizes the distributions of year-normalized citations for JEL code G per journal (year 2015 is excluded here). They should be compared to the ones of Table 9.

Table 25: Year-normalized citations for JEL code G

#### 5.6 Code L: Industrial Organization

Table 27 reports the number of published articles with at least one JEL code L, for each journal and both the full period and our five subperiods. Publications in the AER and ECMA are decomposed in regular and shorter publications. It shows that out of 6,816 articles 996 have at least one JEL code L.

Table 27: Nb of articles with at least one JEL code L

This table should be compared with Table 1. If all JEL codes were equally represented in each journal, the percentages of both tables would be the same. Industrial Organization articles are over-represented in the AER (40.4% vs 32.9%), slightly over-represented in JPE and QJE but drastically under-represented in ECMA (9.4% instead of 21%). Table 28 summarizes the distributions of year-normalized citations for JEL code L per journal (year 2015 is excluded here). They should be compared to the ones of Table 9.

Table 28: Year-normalized citations for JEL code L

#### 5.7 Code O: Economic Development, Innovation, Technological Change, and Growth

Table 30 reports the number of published articles with at least one JEL code O, for each journal and both the full period and our five subperiods. Publications in the AER and ECMA are decomposed in regular and shorter publications. It shows that out of 6,816 articles 859 have at least one JEL code O.

Table 30: Nb of articles with at least one JEL code O

This table should be compared with Table 1. If all JEL codes were equally represented in each journal, the percentages of both tables would be the same. Code O articles are relatively more present in the AER (39.5 vs 32.9%) and QJE (24.3 vs 15.4%) but less in ECMA (6.6 vs 21%). Table 31 summarizes the distributions of year-normalized citations for JEL code O per journal (year 2015 is excluded here). They should be compared to the ones of Table 9.

#### 5.8 Code F: International Economics

Table 33 reports the number of published articles with at least one JEL code F, for each journal and both the full period and our five subperiods. Publications in the AER and ECMA are decomposed in regular and shorter publications. It shows that out of 6,816 articles 543 have at least one JEL code F.

Table 33: Nb of articles with at least one JEL code F

This table should be compared with Table 1. If all JEL codes were equally represented in each journal, the percentages of both tables would be the same. International Economics articles are relatively more present in the AER (45.9 vs 32.9%) and QJE (19.1 vs 15.4%) but less in ECMA (5.4 vs 21%). Table 34 summarizes the distributions of year-normalized citations for JEL code F per journal (year 2015 is excluded here). They should be compared to the ones of Table 9.

# 5.9 Code H: Public Economics

Table 36 reports the number of published articles with at least one JEL code H, for each journal and both the full period and our five subperiods. Publications in the AER and ECMA are decomposed in regular and shorter publications. It shows that out of 6,816 articles 581 have at least one JEL code H.

Table 36: Nb of articles with at least one JEL code H

This table should be compared with Table 1. If all JEL codes were equally represented in each journal, the percentages of both tables would be the same. Public Economics articles are relatively more present in the AER (41.0 vs 32.9%) and JPE (18.0 vs 15.0%) but less in ECMA (8.8 vs 21%). Table 37 summarizes the distributions of year-normalized citations for JEL code H per journal (year 2015 is excluded here). They should be compared to the ones of Table 9.

#### 5.10 Code I: Health, Education, and Welfare

Table 39 reports the number of published articles with at least one JEL code I, for each journal and both the full period and our five subperiods. Publications in the AER and ECMA are decomposed in regular and shorter publications. It shows that out of 6,816 articles 561 have at least one JEL code I.

Table 39: Nb of articles with at least one JEL code I

This table should be compared with Table 1. If all JEL codes were equally represented in each journal, the percentages of both tables would be the same. Code I articles are relatively more present in AER (39.8 vs 32.9%) and qje (25.2 vs 15.4%) but less in ECMA (9 vs 21%) and RESTUD (10.2 vs 15.7%). Table 40 summarizes the distributions of year-normalized citations for JEL code I per journal (year 2015 is excluded here). They should be compared to the ones of Table 9.

#### 5.11 Code R: Urban, Rural, Regional, Real Estate, and Transportation Economics

Table 42 reports the number of published articles with at least one JEL code R, for each journal and both the full period and our five subperiods. Publications in the AER and ECMA are decomposed in regular and shorter publications. It shows that out of 6,816 articles 276 have at least one JEL code R.

Table 42: Nb of articles with at least one JEL code R

This table should be compared with Table 1. If all JEL codes were equally represented in each journal, the percentages of both tables would be the same. Code R articles are relatively more present in AER (39.5 vs 32.9%), JPE (19.0 vs 15.0%) and QJE (23.2 vs 15.4%) but less in ECMA (7.6 vs 21%) and RESTUD (10.6 vs 15.7%). Table 43 summarizes the distributions of year-normalized citations for JEL code R per journal (year 2015 is excluded here). They should be compared to the ones of Table 9.
